annif tutorial

TFIDF project

• A project is used to set a vocabulary, a backend (i.e. algorithm), and other settings.

- A project is used to set a vocabulary, a backend (i.e. algorithm), and other settings.
- Projects are defined in a file usually called projects.cfg located in the current directory where Annif is executed.
 - This default filename/location can be overridden using ANNIF_PROJECTS
 environment variable or --projects option after a command.

- A project is used to set a vocabulary, a backend (i.e. algorithm), and other settings.
- Projects are defined in a file usually called projects.cfg located in the current directory where Annif is executed.
 - This default filename/location can be overridden using ANNIF_PROJECTS environment variable or --projects option after a command.
- A project is identified by a project id, which is typically a short string such as yso-tfidf-en.

- A project is used to set a vocabulary, a backend (i.e. algorithm), and other settings.
- Projects are defined in a file usually called projects.cfg located in the current directory where Annif is executed.
 - This default filename/location can be overridden using ANNIF_PROJECTS
 environment variable or --projects option after a command.
- A project is identified by a project id, which is typically a short string such as yso-tfidf-en.
- annif list-projects command shows the configured projects.

Exercise 2: TFIDF project

• The "Hello World" algorithm of automated subject indexing: quick to set up, train and test, but not the final say!

Example projects.cfg file for TFIDF project

```
[yso-tfidf-en]
name=YSO TFIDF project
language=en
backend=tfidf
vocab=yso-en
analyzer=snowball(english)
```

```
[stw-tfidf-en]
name=STW TFIDF project
language=en
backend=tfidf
vocab=stw-en
analyzer=snowball(english)
```

1. Add project configuration to projects.cfg; verify using annif list-projects

- 1. Add project configuration to projects.cfg; verify using annif list-projects
- Load vocabulary: annif loadvoc PROJECT_ID SUBJECT_FILE

- 1. Add project configuration to projects.cfg; verify using annif list-projects
- 2. Load vocabulary: annif loadvoc PROJECT_ID SUBJECT_FILE
- 3. Train: annif train PROJECT_ID TRAINING_DATA

TSV or SKOS/RDF

(gzipped) TSV file or directory

- 1. Add project configuration to projects.cfg; verify using annif list-projects
- 2. Load vocabulary: annif loadvoc PROJECT_ID SUBJECT_FILE
- 3. Train: annif train PROJECT_ID TRAINING_DATA

TSV or SKOS/RDF

(gzipped) TSV file or directory

- 1. Add project configuration to projects.cfg; verify using annif list-projects
- 2. Load vocabulary: annif loadvoc PROJECT_ID SUBJECT_FILE
- 3. Train: annif train PROJECT_ID TRAINING_DATA

TSV or SKOS/RDF

- 4. Test:
 - a. Using one sentence:

echo "This is an example." | annif suggest PROJECT_ID

(gzipped) TSV file

or directory

- 1. Add project configuration to projects.cfg; verify using annif list-projects
- 2. Load vocabulary: annif loadvoc PROJECT_ID SUBJECT_FILE
- 3. Train: annif train PROJECT_ID TRAINING_DATA

TSV or SKOS/RDF

- 4. Test:
 - a. Using one sentence:

echo "This is an example." | annif suggest PROJECT_ID

(gzipped) TSV file

or directory

b. Using a text file:
annif suggest PROJECT ID <FILE.TXT</p>
